

Now, please provide another Excel VBA code that performs the following:

Allow me to select the folder where all the individual customer PDF files are stored.

The Excel file contains customer names in Column B.

Each PDF file is already named using the customer name (e.g., Ravi_Sharma.pdf).

The VBA code should:

Search for each customer's PDF in the selected folder based on the name in Column B.

Add the full file path (including the file name and extension) to Column F in the same row as the customer.

This way, each customer in Column B will have their corresponding PDF file path listed in Column F.
